AB	<p>The present invention relates to an isolated DNA mol. consisting of the 5' and 3' regions of the porcine wap gene locus encoding Whey acidic protein. The invention relates to cis-regulatory elements of porcine gene wap, which are able to direct the efficient expression of the transgenes of interest, such as antibody, growth factor, in milk, leading to production of large quantities of heterologous proteins. The invention is also directed to mammalian cells comprising the said DNA mol. and non human animals obtained therefrom, which are preferably able to express a polypeptide of interest in milk. The invention relates to a method for insulating the expression of an introduced heterologous gene from silencing and variegation effect in chromatin into which the gene has integrated.</p>
